

EverCare: An AI-Assisted Elderly Health Management App with IoT Blood Pressure Monitoring

1. Problem and SDG Alignment

Many elderly people experience difficulty managing their health information, medications, medical appointments, and blood-pressure records. Some senior citizens rely on handwritten notes or family members to remember their schedules, which may result in missed medication, forgotten appointments, and inconsistent health monitoring. This problem is especially concerning for elderly individuals with hypertension who need to check their blood pressure regularly.

EverCare supports United Nations Sustainable Development Goal 3: Good Health and Well-Being by helping elderly users monitor important health information and organize their daily healthcare needs. Through an elderly-friendly mobile application, IoT blood-pressure monitoring, and AI-assisted health summaries, EverCare aims to encourage regular monitoring, proper medication management, and better preparation for medical consultations.

2. Project Proposal

EverCare is an AI-assisted elderly health-management mobile application designed to make daily healthcare monitoring simpler, safer, and more organized. Its primary target users are senior citizens, although family members may also assist them when using the application. The app will feature large text, clear icons, simple navigation, and an accessible interface suitable for elderly users.

The application's main IoT feature will use a compatible Bluetooth upper-arm blood-pressure monitor to transfer blood-pressure and pulse readings to EverCare through Bluetooth Low Energy. The app will display the recorded measurements, history, and health trends. Its AI-assisted feature will provide simple summaries and observations based on the user's recorded information without replacing professional medical advice. EverCare will also include medication schedules, medical appointments, emergency information, notifications, and profile management.
